

Lee has used a part-whole model to calculate $48 \div 4$. He has partitioned each number in the calculation and worked out that the answer is 24. Marisa thinks Lee has made a mistake. Who do you agree with? Explain your reasons.

The answer to $96 \div 3$ must be greater than the answer to $68 \div 2$ as both the divisor (the number you are dividing by) and dividend (the number you are dividing) are greater.

Do you agree with Marisa? Explain your reasons.
